Instead of presenting the student reader with a bewildering array of 'facts' about these two modes of communication, this book asks students to investigate the differences for themselves. Having worked through this book, students will have considered a wide range of spoken and written varieties and will be able to formulate their own opinions as to the differences present. English in Speech and Writing will be an essential text for students of language, linguistics and communication studies, as well as non-native speakers of English and their teachers.

Economic transformation and diversification require solutions that take account of the political economy of reform. This book explores the process of economic transformation, using Senegal as an example. Sound macroeconomic and fiscal policies are prerequisites for achieving this kind of transformation, but these policies need to include the appropriate industrial policies and good economic governance, which provide incentives to help small- and medium-sized enterprises emerge from the informal sector and for foreign direct investment to use the country as a platform for globally competitive production. In many low-income countries extensive rent seeking and patronage have generated stability at the expense of inclusive growth and held back development. Although policymakers know what is needed to address these problems and achieve economic transformation and diversification, how to do it remains a challenge. This book shows how the political economy of reform may be navigated to achieve transformation. For example, the use of special economic zones may solve the problem if good global governance is emphasized, along with linking the zones to the global economy.

In communication acoustics, the communication channel consists of a sound source, a channel (acoustic and/or electric) and finally the receiver: the human auditory system, a complex and intricate system that shapes the way sound is heard. Thus, when developing techniques in communication acoustics, such as in speech, audio and aided hearing, it is important to understand the time–frequency–space resolution of hearing. This book facilitates the reader’s understanding and development of speech and audio techniques based on our knowledge of the auditory perceptual mechanisms by introducing the physical, signal-processing and psychophysical background to communication acoustics. It then provides a detailed explanation of sound technologies where a human listener is involved, including audio and speech techniques, sound quality measurement, hearing aids and audiology. Key features: Explains perceptually-based audio: the authors take a detailed but accessible engineering perspective on sound and hearing with a focus on the human place in the audio communications signal chain, from psychoacoustics and audiology to optimizing digital signal processing for human listening. Presents a wide overview of speech, from the human production of speech sounds and basics of phonetics to major speech technologies, recognition and synthesis of speech and methods for speech quality evaluation. Includes MATLAB examples that serve as an excellent basis for the reader’s own investigations into communication acoustics interaction schemes which intuitively combine touch, vision and voice for lifelike interactions.
